

# Architektur und Implementierung von Datenbanksystemen

## Task 3

Team 3 - Gründlinger Diana, Huber Marcel, Klotz Thomas, Targa Aaron, Thalmann Matthias

# SQL Server Data Page

- Page size: 8kb
- 96-byte header containing:
  - Number of rows
  - page type
  - free space
  - ...
- Rows follow serially after header
- Row offset at end, reverse from rows

# Comparison with block from lecture

## Illustration

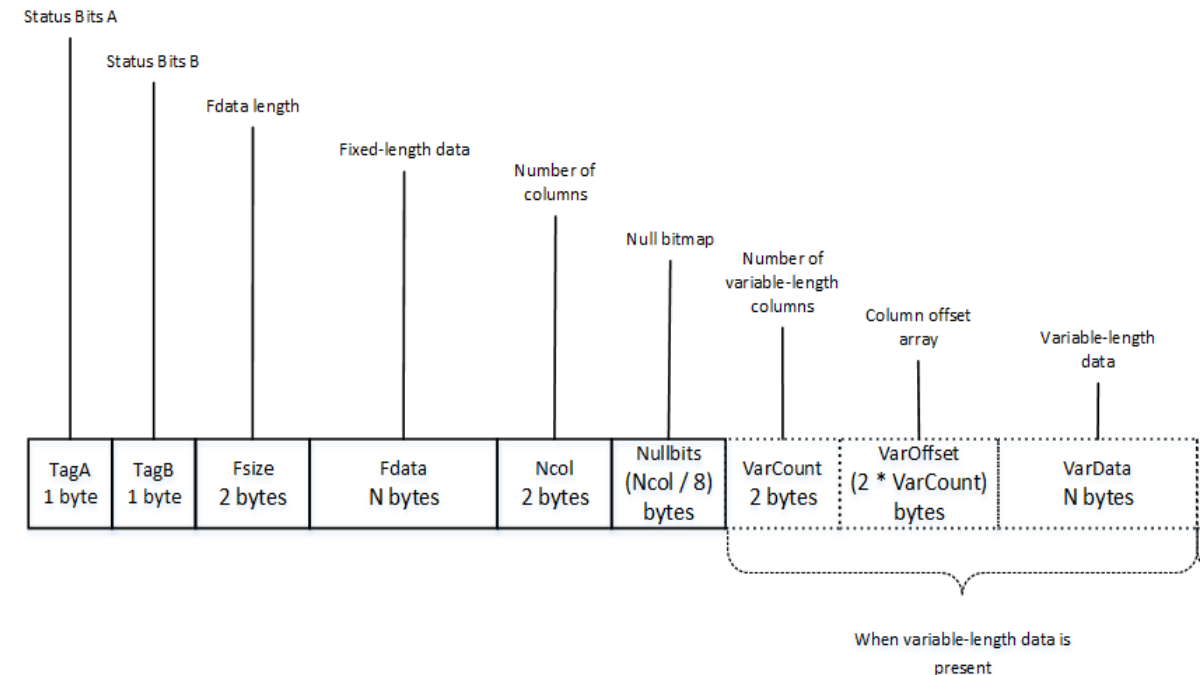

- Records start at the end, grow towards start
- Offset Table starts after header, grows towards end
- Size: 4kb

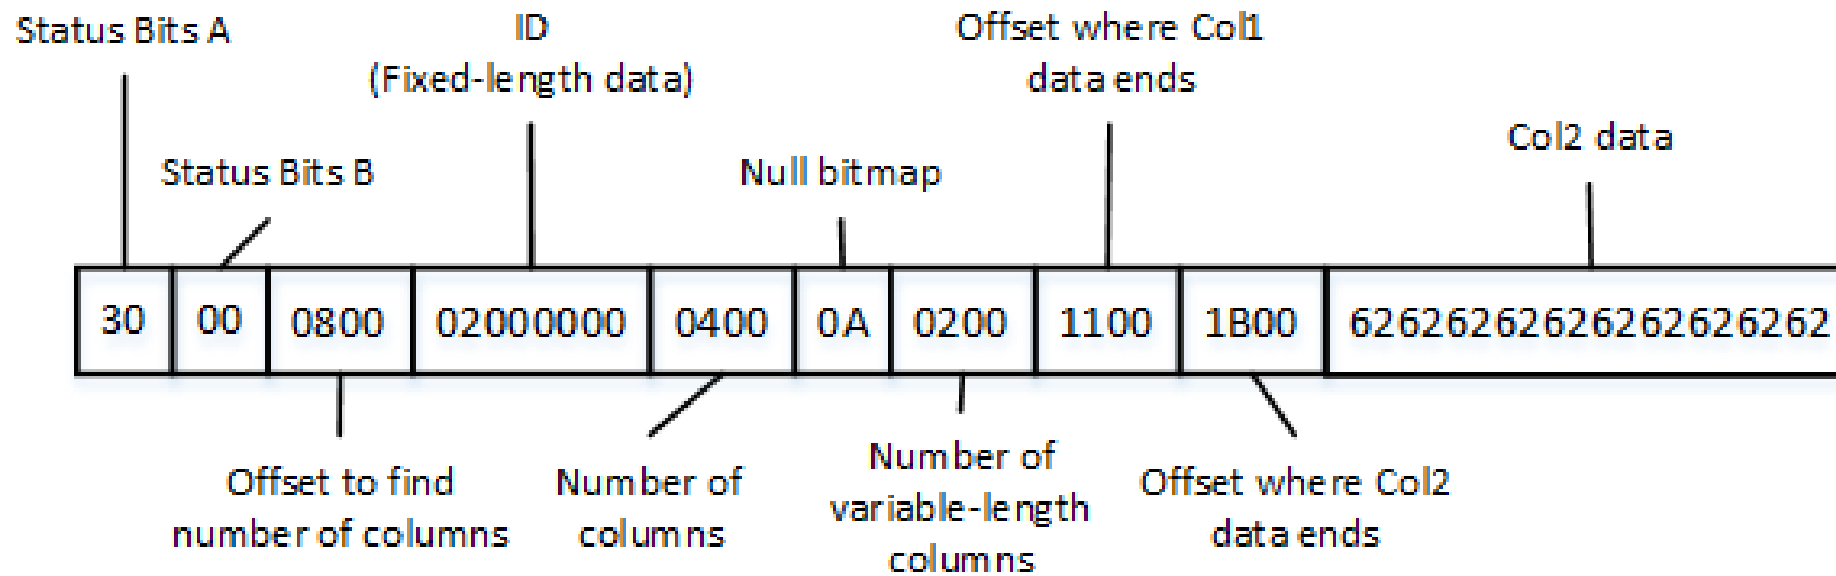

# Record Format SQL Server

- SQL Server uses fixedvar format
- Fixed length:
  - **Tag A, Tag B:** Status bits for row data
  - **Fsize:** Pointer to end of fixed data (ncol)
  - **Ncol:** Number of columns total
  - **Nullbits:** Null bitmap array (for all columns)
- Variable length:
  - **VarCount:** Number of columns n
  - **VarOffset:** Offset array with n offset values

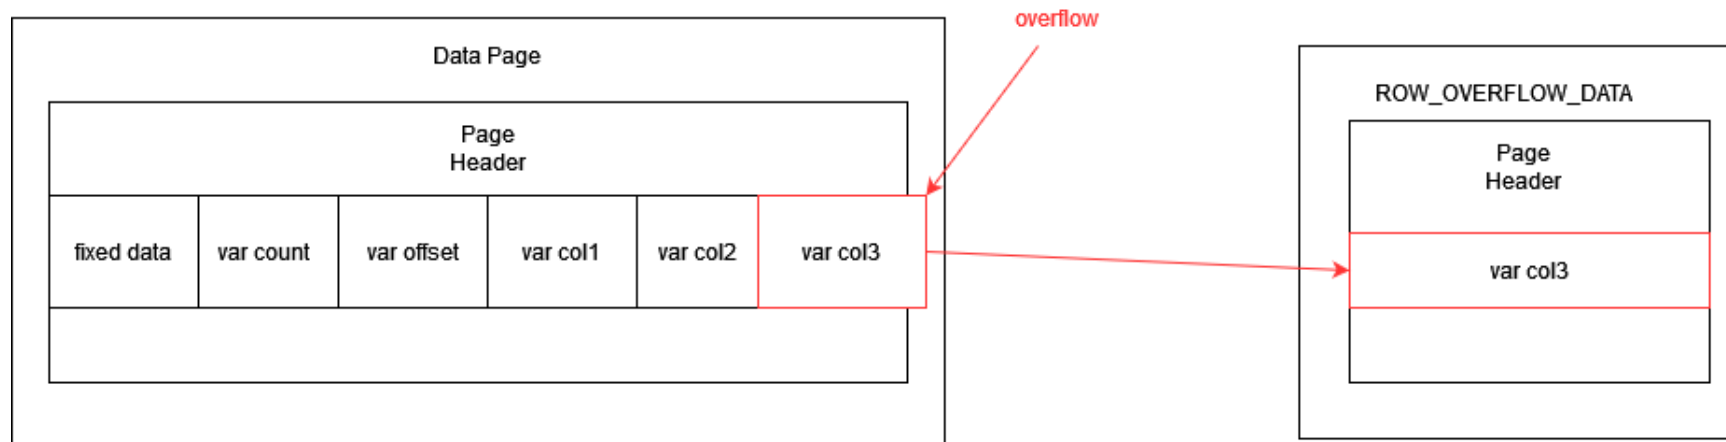

# Record Example

# Row overflow

- Maximum row size: 8060 Bytes (except text/image pages)
- Columns of rows can be moved off the page
- Upon overflow SQL server moves variable length columns to ROW\_OVERFLOW\_DATA page
- Overflow = update or insert operation that increases row size over 8060 Bytes
- Upon reduction of row size under 8060 Bytes moved columns get moved back from ROW\_OVERFLOW\_DATA
